

# Technical Means with Relevance for Compliance - The Role of Open Source Information

**Gunnar Jeremias & Mirko Himmel**

Research Group for Biological Arms Control

University of Hamburg, Germany

15 December 2015

Supported by:

Federal Foreign Office

Carl Friedrich von Weizsäcker-  
Centre for Science  
and Peace Research

Research Group for  
Biological Arms Control

# Contents

## **Part I: Technical Confidence Building Measures**

- Historical perspective: What do we learn from the past?
- New approaches: What could we do in the future?

## **Part II: Use of Open Source Information in Compliance Monitoring**

- The Big Data Universe
- Bringing things together: the analytical approach

# Part I: Technical Confidence Building Measures

## Confidence Building in the context of the Biological Weapons Convention

### How to promote confidence building? *Examples:*

- Declarations (e.g. CBMs)
- Exchange of information & expert views during the ISPs
- Peer review mechanisms
- Practical exercises of the UNSGM for the investigation of alleged use of BW
- **Technical Means** (applicable also for a voluntary continuous monitoring of certain fields of interest)

# Part I: Technical Confidence Building Measures

## Confidence Building in the context of the Biological Weapons Convention

### Problem:

The inherent **dual use dilemma** in biological sciences makes it rather difficult to determine the intent!

- Almost all techniques, equipment, and many biological materials show a dual use potential
- Single pieces of information often give unsatisfactory results in deciphering the intention behind activities

**Combinatorial approaches are required!**

Carl Friedrich von Weizsäcker-  
Centre for Science  
and Peace Research

Research Group for  
Biological Arms Control

# Part I: Historical Perspective

1970ies:

**How to monitor compliance  
within an upcoming biological  
arms control regime?**

Carl Friedrich von Weizsäcker-  
Centre for Science  
and Peace Research

Research Group for  
Biological Arms Control

# Part I: Historical Perspective

## How to assess compliance with the BWC?

Possible activities in **violation** of the BWC:

- **Research** [for non-peaceful purposes]
- **Development** [for non-peaceful purposes]
- **Field testing** [of BW agents, delivery and dissemination]
- **Production** [of BW agents & bioweapons at large-scale]
- **Transport and storage** [of bioweapons]
- **Training** [troops, civil protection services]

*Source: The Problem of Chemical and Biological Warfare - Vol. V (SIPRI, 1973); modified.*

1973

and Peace Research

Research Group for  
Biological Arms Control

Detectable  
footprint in  
the open source  
data universe?

# Part I: Historical Perspective

## How to assess compliance with the BWC?

### Monitoring methods:

- **Inspections** [of laboratories, production facilities etc.]
- **Budgetary inspections**
- **Remote observation** [e.g. production facilities]
- **Economic analysis** [e.g. trade monitoring]
- **Literature surveillance** [research, applied S&T, patents,...]

Applicable  
by analysing  
open source  
information

*Source: The Problem of Chemical and Biological Warfare - Vol. V (SIPRI, 1973); modified.*

1973

Carl Friedrich von Weizsäcker-  
Centre for Science  
and Peace Research

Research Group for  
Biological Arms Control

# Part I: Historical Perspective

## How to provide information on compliance?

- **Secret flows of information:** e.g. remote observation (aerial or satellite surveillance), sensors on the ground to analyse air or water samples
- **Formal international monitoring:** inter-governmental agreements to open up information otherwise not available
- **Informal international monitoring:** citizens of a country take part in information gathering and sharing
- **Open flows of information:** press, radio, official reports, scientific literature, „gossip“ etc.

*Source: The Problem of Chemical and Biological Warfare - Vol. V (SIPRI, 1973); modified.*

Applicable  
by analysing  
open source  
information

1973

Carl Friedrich von Weizsäcker-  
Centre for Science  
and Peace Research

Research Group for  
Biological Arms Control

# Part I: Historical Perspective

## How to assess compliance with the BWC?

### Off-site monitoring methods:

- **Data exchange** (declarations, notifications)
- **Inspections** (including sampling and identification)
- **Remote sensing** (surveillance by satellite/aircraft, ground-based)
- **Information monitoring** (publications, legislation,...)

*Source: Summary Report (BWC/CONF.III/VEREX/8); modified.*

1993

Applicable  
by analysing  
open source  
information

and Peace Research

Research Group for  
Biological Arms Control

# Part I: Historical Perspective

## How to assess compliance with the BWC?

### On-site monitoring methods:

- **Exchange visits**
- **Inspections** (including sampling and identification)
- **Continuous monitoring** (by instruments, by personnel)

*Source: Summary Report (BWC/CONF.III/VEREX/8); modified.*

1993

Carl Friedrich von Weizsäcker-

and Peace Research

Research Group for  
Biological Arms Control

## Conclusion I:

**Evaluated methods and technical means are known to monitor compliance with the BWC.**

# How could open source information contribute to compliance monitoring?

## Part II: New Approaches

### Possible Technical Measures (TM): Remote sensing

1990ies		Today	
TM	Purpose	TM	Benefits
<b>Surveillance by satellite</b> (military/commercial): specific acquisition tasks required	<b>Determine characteristics</b> of known facilities, test fields etc. + continuous monitoring  <b>Detection</b> of suspicious facilities, test fields etc. + continuous monitoring	<b>Satellite imagery from open sources:</b> Google Earth, Bing, Here etc.; Landsat 5  <b>Ground-based imagery:</b> Panoramio Google Street View; Flickr, Twitter, Facebook  <b>Annotations:</b> Wikimapia	<b>Free access to images with high resolution</b>  Global search possible  Time series from historical imagery archive  <b>Document + share results!</b>

# Part II: New Approaches

## Possible Technical Measures (TM): Diagnostics

1990ies		Today	
TM	Purpose	TM	Benefits
<b>Classical methods in diagnostics</b>  Rapid detection assays  Spectroscopy  Biosensors	<b>Detection and identification of biological agents</b> in a variety of different samples (water, air, soil, wastes etc.)	<b>Next Generation Sequencing</b>  <b>Mobile/handheld PCR machines</b>  Spectroscopy  (Upcoming: <b>Lab-on-the-Chip</b> analytical devices)	Flexible, fast and specific  Customised detection  Non-invasive measurement  Combinatorial analytics

## Part II: New Approaches

What could we do in the future?

**The increasing accessibility of**

- a variety of **open source information** including technical and scientific data
- new **analytical techniques** applicable even by semi-professional users

**will globally enable more and more actors to contribute compliance-relevant information.**

**What to do with these information? How to make them usable within the BWC regime?**

Carl Friedrich von Weizsäcker-  
Centre for Science  
and Peace Research

Research Group for  
Biological Arms Control

# What is OSI?

“Open source information may be defined as that information which is **publicly available and that anyone can lawfully obtain by request, purchase, or observation** (under consideration of legal copyright requirements).“

Source: U.S House of Representatives Committee

# What is OSI?

## Categories:

1. The expertise of individual experts,
2. Commercial data,
3. „Grey“ literature, such as written information by the private sector, government sources, and academia that available on only a limited basis.
4. Information that is widely available to anyone.

**„Big data“ as subset of OSI.**

# Limitations of Big Data

Challenge	Solution
Amount	Filter the data
Correctness	Verify the data
Steadyness:	Save the data
Variability	Make the data compatible
Comprehensiveness	Complete the data
Language	Translate

With awareness of these limitations:

**Highly valuable dataset,  
which is applicable to treaty monitoring.**

# Why use Open Source Information?

- Because it's there!
- No stakeholder can run away any longer from the fact that relevant information are available in open sources,
- The regime is weakened if its functions are not supported by informational input,
- With the absence an official mechanism to gather, and evaluate compliance relevant information, experts/NGOs will do so.

# Using OSI is not! OSINT!

80-90 % OSINT in the intel of States

but **OSINT** does not produce transparency!

- **NTMs**: exclusive technology: **Secrecy**
- **PTMs**: public/open source technology: **Public transparency**.

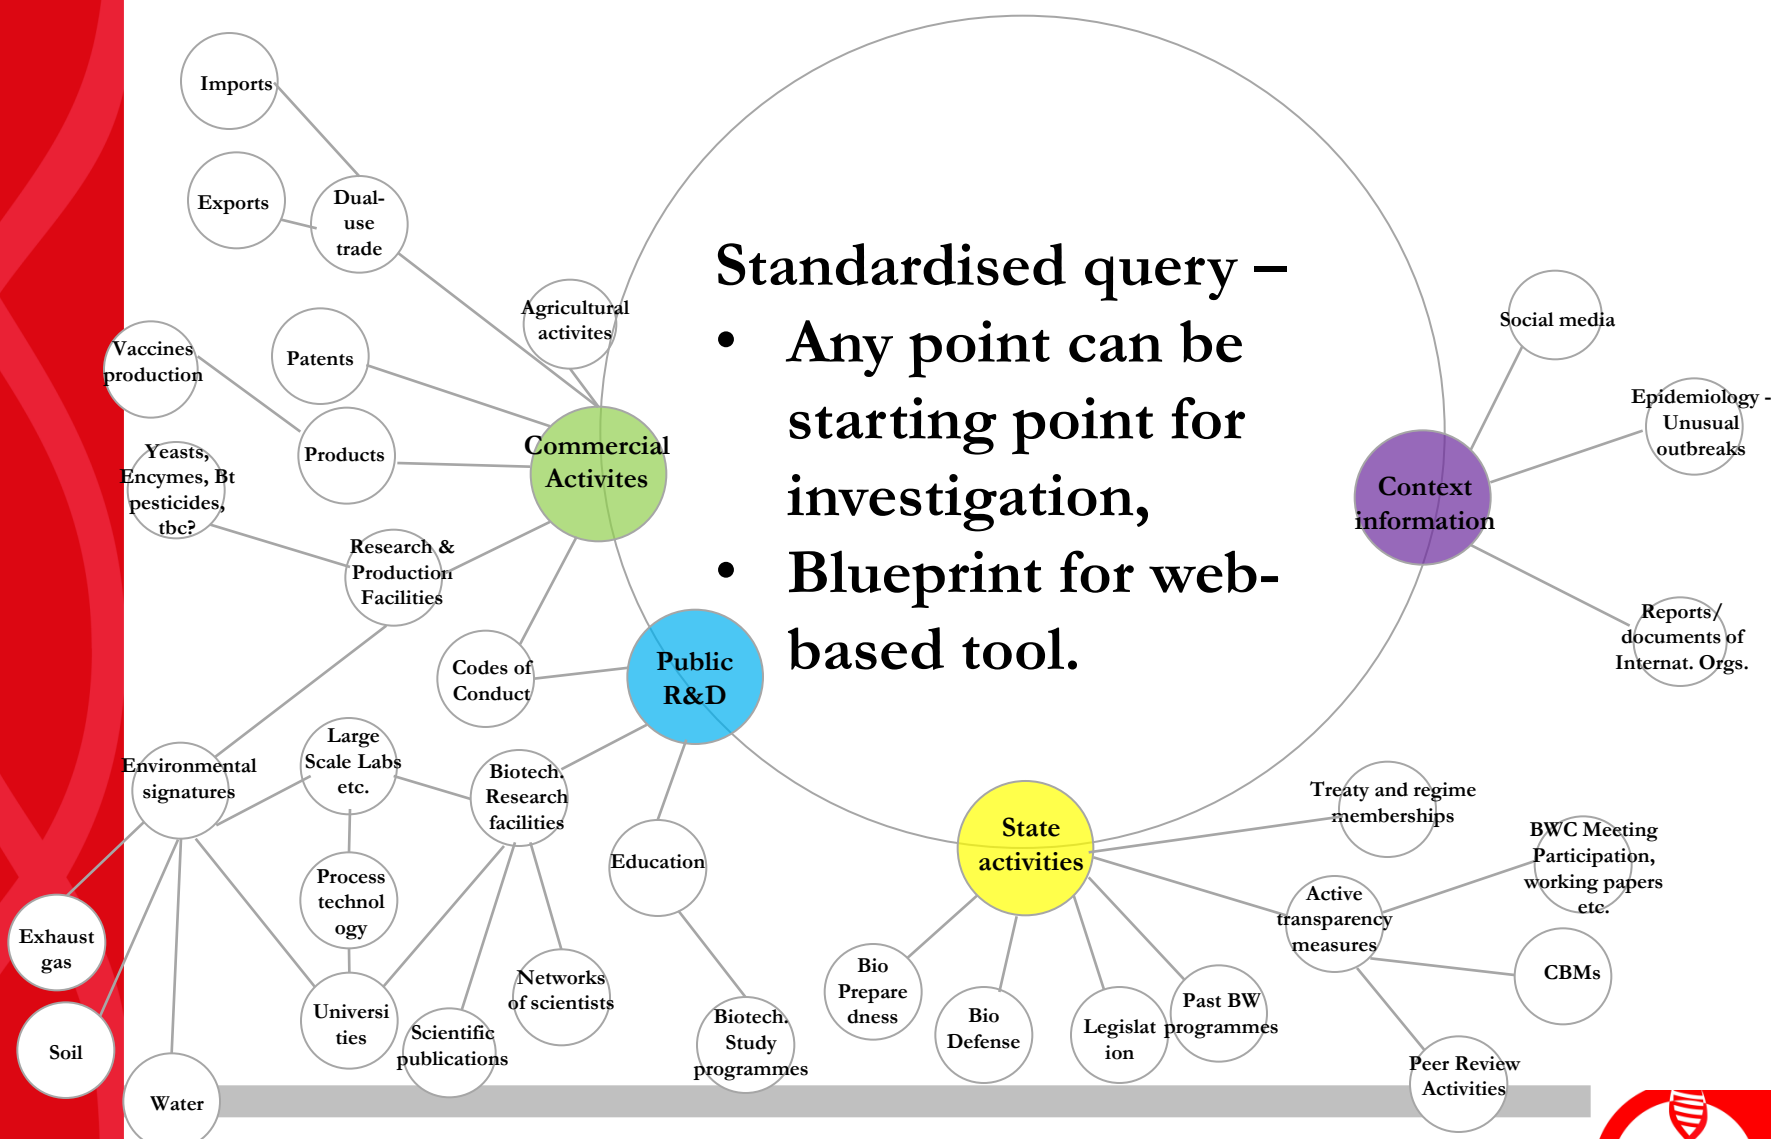

## Goals of OSI-analysis by civil society

- **To build transparency and therewith:**
  - Provide an empirical groundwork to foster confidence in compliance with articles I and III,
  - Facilitate an informed debate on the implementation of article X,
  - Identify qualified questions rather than proofs.

## Part II: Use of Open Source Information in Compliance Monitoring

**Standardised query –**

- Any point can be starting point for investigation,
- Blueprint for web-based tool.

## Context information

### Epidemiology/unusual outbreaks:

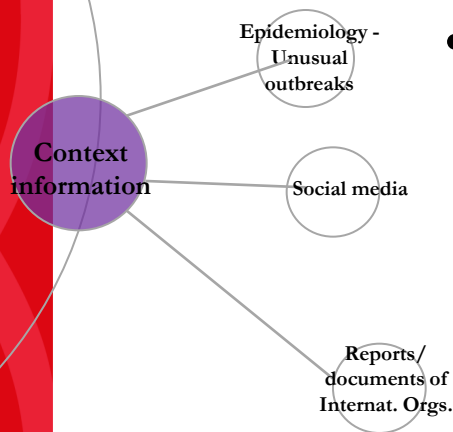

- [medisys.org](http://medisys.org), [healthmap.org](http://healthmap.org),

### Reports of International Organisations

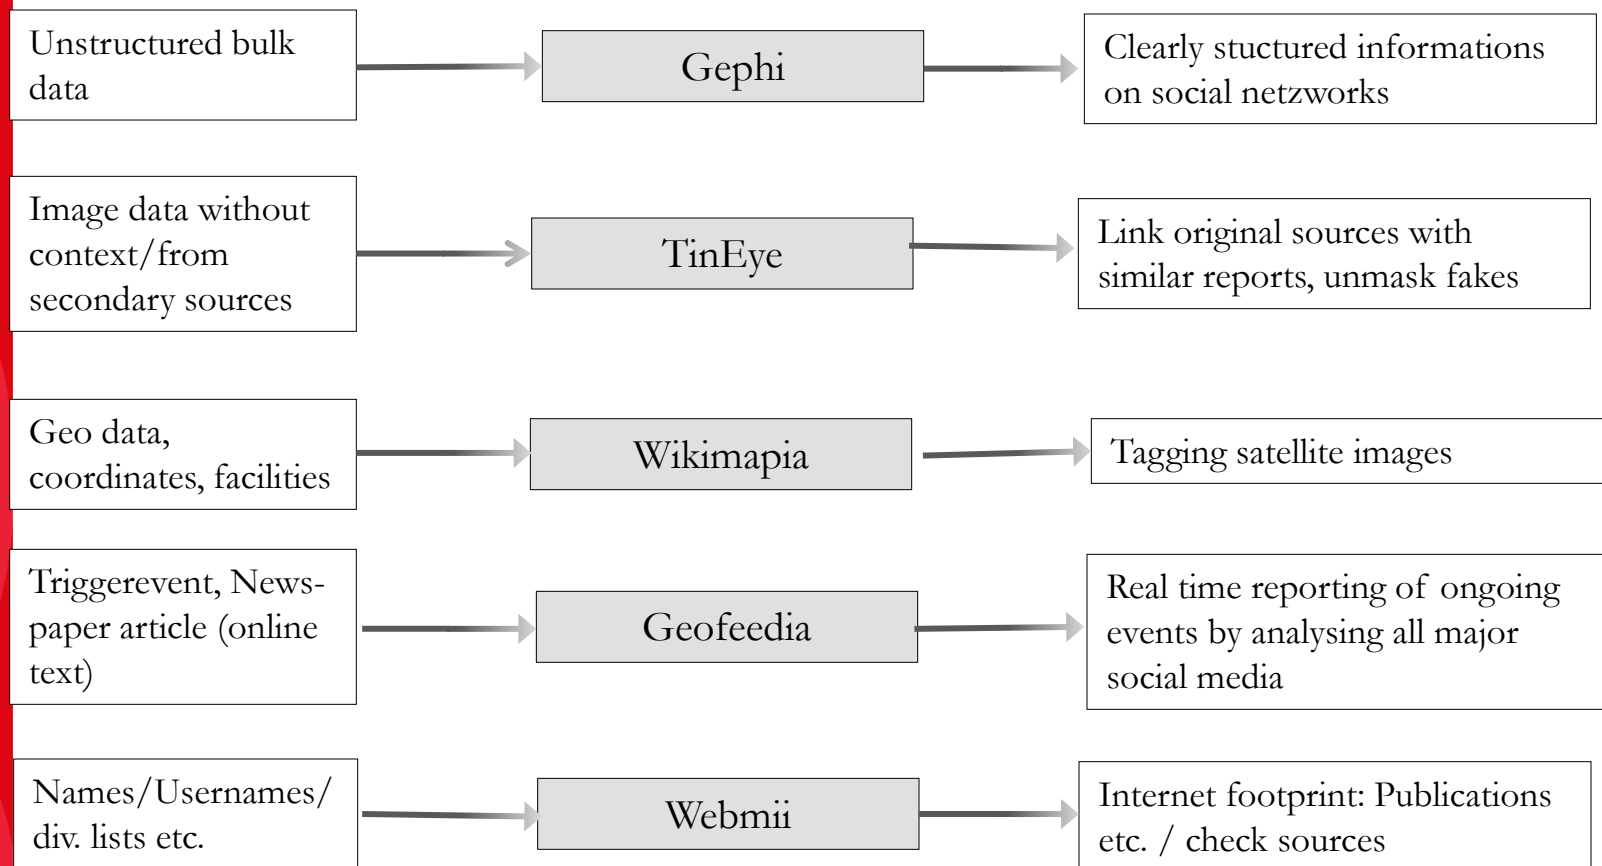

- Seldom Cases

### Social media:

- Free use / licenses for a number of online tools

### Analysis of specific internet content

# State activities

**Treaty memberships:** BWC, CWC, Cartagena,...?

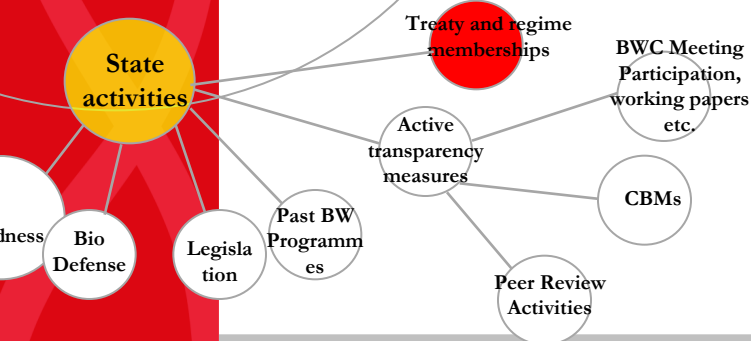

**Legislation:** Sufficient?

**Bio Defense:** Any programme; suitable?

**Bio Preparedness:** Any activities; suitable?

**Active transparency measures:** CBMs, Peer Review activities,...?

**Past BW Programmes:** Sufficient information?

# Public R&D

## General biotech/life sciences education:

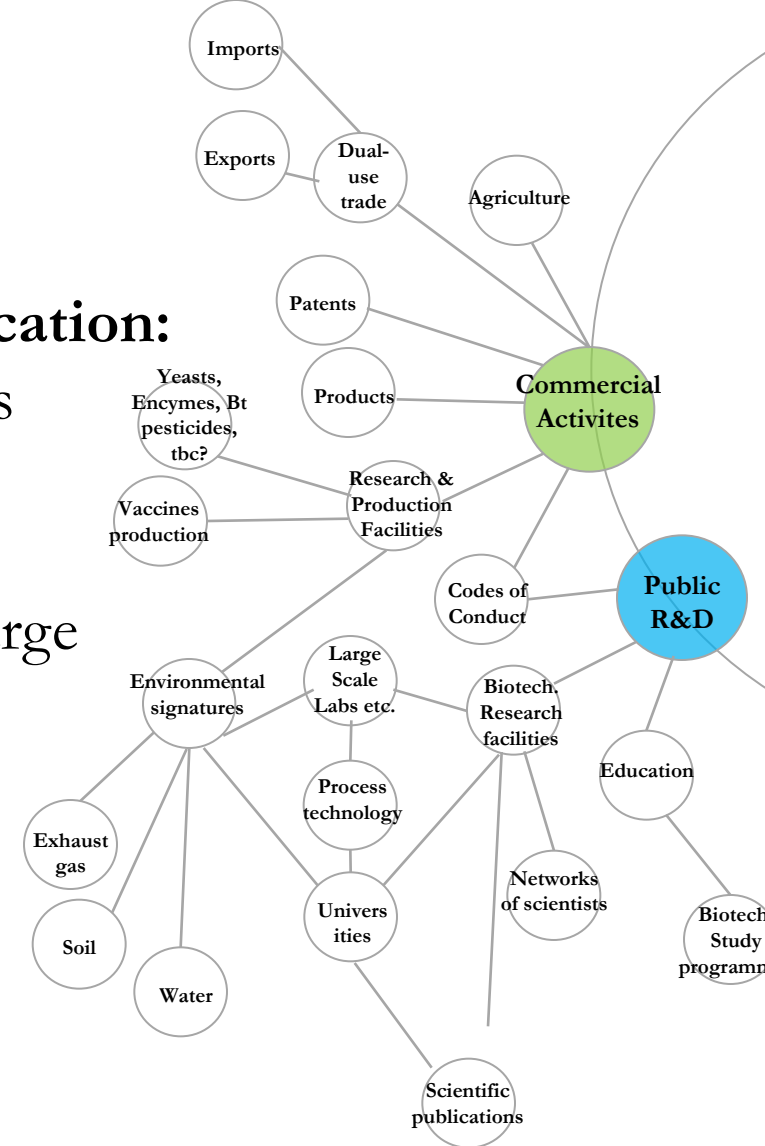

Study programmes in the life sciences and biotechnology?

## Bioprocess technology education:

Know-how on the construction of large scale production facilities?

## Large scale research institutions:

Transparent work programmes,...?

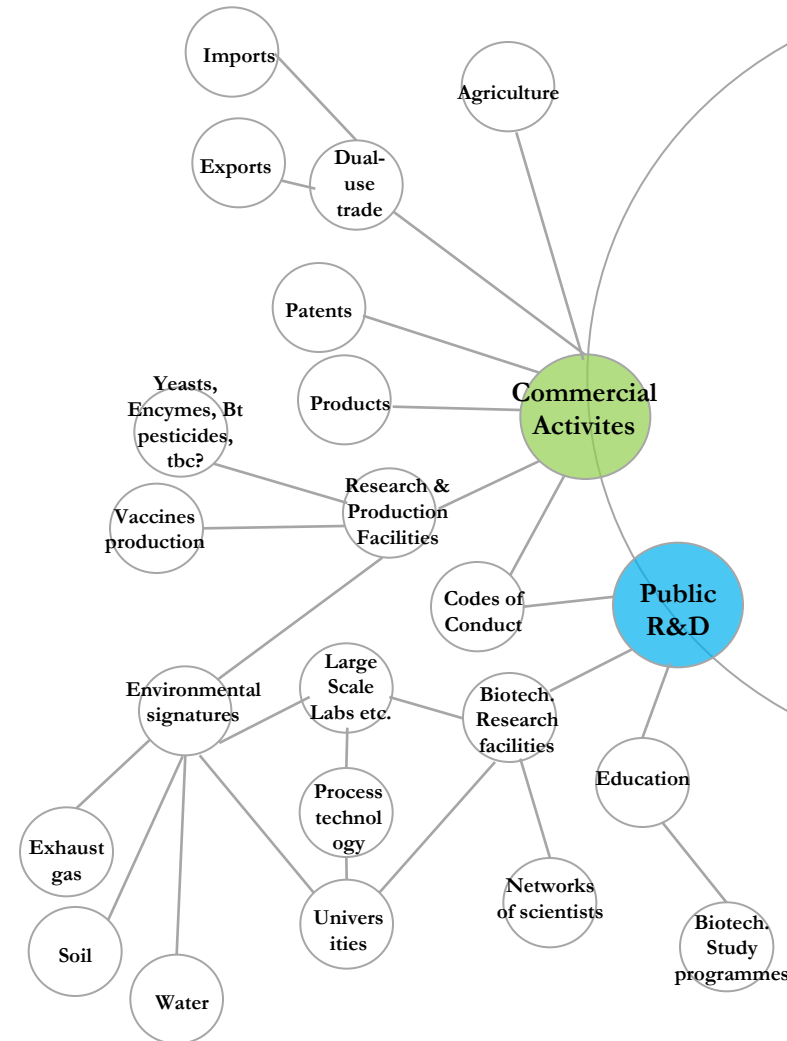

# Part II: Use of Open Source Information in Compliance Monitoring

## Commercial Activities

**Patents:** what is being developed for commercial use?

**Bio-pharma products:** products, production facilities,...?

**Relevant agriculture:**  
e.g. castor beans?

# Conclusion

- **Technical revolutions open the door** towards the effective use of PTMs,
- Increased (public) transparency is **indispensable in the regime**,
- A public OS mechanism is **not OSINT**,
- Requirement of a **standardised methodology**,
- **Exchange with other fields** prerequisite!
- OSI based monitoring also with **high relevance for activities under article X**.

# Thank you!
